

BPA free

Why worry about BPA?

Use F&W's BPA-Free Silicone Nose Pads

For years polycarbonate material has been used for the inserts of click-type and screw-type nose pads. One of the basic substances for producing polycarbonate material is Bisphenol A (BPA).

BPA is bound in the polymer structure. Through heat however, harmful components of BPA can be released. And according to California Prop. 65, products are required to provide a "clear and reasonable warning" of BPA's hazards. There is no need for this declaration with our new product.

We developed a 100% BPA-free, crystal-clear insert, which combined with our high-quality silicone material, offers a completely harmless product for body and health.

**100% Made in Germany in our own facilities
and with tested materials only**
